

**Yes, it's true**

Single-use HF instruments are completely  
disposed of after their clinical use –  
this means: thrown away.

**More sustainable  
than you may think.**

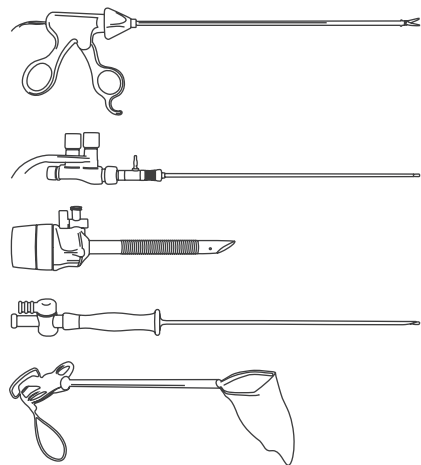

Single-use HF instruments

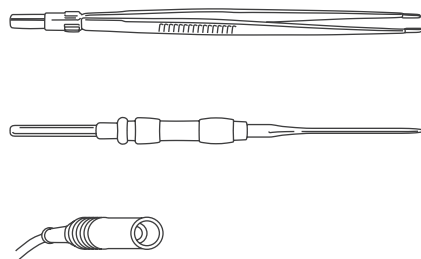

## But it is also true

That the single-use instruments are reused for thermal purposes – so ENERGY is generated from them: for heating, for the economy, and much more.

We all know: even multiple-use instruments are not as „Clean“ as they may seem: Cleaning is energy-intensive and produces chemically contaminated substances which are problematic. In addition, outsourcing to decentralized sterilization service providers results in considerable transport and logistics costs – certainly not a „Sustainable“ approach.

## What matters to us and our customers

We don't just manufacture medical technology instruments at Seemann Technologies. We are also a family business, with regional ties to Böttingen in southern Germany. Our corporate philosophy has always focused on treating our customers and partners as well as our resources in a responsible manner. Sustainability is a core issue for our company, and we try to achieve it in a variety of ways:

with intelligent logistics concepts, we focus on efficient solutions for the transport of our products

we reduce the amount of waste we produce to a minimum both at work and in our everyday lives

with our photovoltaic system, we rely on electricity from solar power and reduce our dependence on electricity and gas

with electric vehicles, we reduce the consumption of fossil fuels as much as possible

## In more direct terms: we don't compromise here!

As a manufacturer of medical technology instruments, we bear a significant responsibility. When it comes to the safety and health of people, we make no compromises – and, yes: safety ALWAYS comes before sustainability.

### What speaks in favor of single-use HF instruments:

absolute safety  and hygiene :  
each instrument is new and unused

best availability :  
no one has to wait for instruments to be sterilized
